Electoral Geography, the analysis of spatial patterns of voting, is undergoing a renaissance with new methodological advances, theoretical shifts and changes in the political landscape. Integrating new conceptual approaches with a broad array of case studies from the USA, Europe and Asia, this volume examines key questions in electoral geography: How has electoral geography changed since the 1980s when the last wave of works in this sub discipline appeared? In what ways does contemporary scholarship in social theory inform the analysis of elections and their spatial patterns? How has electoral geography been reconfigured by social and technological changes and those that shape the voting process itself? How can the comparative analysis of elections inform the field? In addressing these issues, the volume moves electoral geography beyond its traditional, empiricist focus on the United States to engage with contemporary theoretical developments and to outline the myriad theoretical, conceptual and methodological perspectives and applications that together are ushering in electoral geography's revitalization. The result is a broader, comparative analysis of how elections reflect and in turn shape social and spatial relations. An author subject index to selected general interest periodicals of reference value in libraries. A magisterial history of the titanic struggle between the Roman and Jewish worlds that led to the destruction of Jerusalem. Martin Goodman—equally renowned in Jewish and in Roman studies—examines this conflict, its causes, and its consequences with unprecedented authority and thoroughness. He delineates the incompatibility between the cultural, political, and religious beliefs and practices of the two peoples and explains how Rome's interests were served by a policy of brutality against the Jews. At the same time, Christians began to distance

themselves from their origins, becoming increasingly hostile toward Jews as Christian influence spread within the empire. This is the authoritative work of how these two great civilizations collided and how the reverberations are felt to this day. Physical distance and time are considered basic dimensions not only of a physical system but of an economic system as well. Space, time, supply, and demand are, when interwoven into a pattern of analysis, a vitally important aspect of the American economic system viewed in a time-space continuum. This book presents the results of research into this theory of geographically influenced price ranges. With emphasis on the slowly recognized and slowly emerging concepts of space and time, the author surveys the development of thought in economics and the physical sciences, from Galileo's time onward, and points out that the end has not been reached: we are only beginning to grasp the significance of time and space relationships. This phase of research, which William Warntz calls "macrogeography", represents a distinct break with conventional microscopic descriptive aerial studies that have characterized geographic research in the United States for many years. This book is dedicated to the premise that there has long been a "fallacy of composition in American geography." Warntz feels that the existing notion that a mosaic of microscopic aerial economic studies covering the United States would produce a valid picture of the American economy as a space-occupying system will be overcome by the adoption of a macroscopic point of view and the recognition of distance as a basic dimension. A macroscopic geography, recognizing that an economic system exists in a space (time) continuum and consists of integrated units, coordinated by interdependence and having a functional consistency and an organized unity greater than the sum of its parts, is within the reach of modern economic geographers. *Toward a Geography of Price* is an important start in that direction. This particular study covers the United States production by states of four crops in the decade 1940-49. Using the geographic center of each of the forty-eight states, the author has worked out 2,304 distance relationships and, over the decade, 156 time relationships. In addition he has produced space

potentials from income-weighted population figures. Using standard mathematical procedures, he puts these figures to the test and finds reason to advance his original hypothesis to theory. The entire study is presented with remarkable compactness and clarity that will hold the attention of geographers, economists, econometricians, and the serious reader interested in the economic phenomena of our day.
