The Death of Drawing Apr 08 2021 The Death of Drawing explores the causes and effects of the epochal shift from drawing to computation as the chief design and communication medium in architecture. Drawing both framed the thinking of architects and organized the design and construction process to place architects at its center. Its displacement by building information modeling (BIM) and computational design recasts both the terms in which architects think and their role in building production. Author David Ross Scheer explains that, whereas drawing allowed architects to represent ideas in form, BIM and computational design simulate experience, making building behavior or performance the primary object of design. The author explores many ways in which this displacement is affecting architecture: the dominance of performance criteria in the evaluation of design decisions; the blurring of the separation of design and construction; the undermining of architects' authority over their projects by automated information sharing; the elimination of the human body as the common foundation of design and experience; the transformation of the meaning of geometry when it is performed by computers; the changing nature of design when it requires computation or is done by a digitally-enabled collaboration. Throughout the book, Scheer examines both the theoretical bases and the practical consequences of these changes. The Death of Drawing is a clear-eyed account of the reasons for and consequences of the displacement of drawing by computational media in architecture. Its aim is to give architects the ability to assess the impact of digital media on their own work and to see both the challenges and opportunities of this historic moment in the history of their discipline.

Concepts are illustrated with examples from theatre, film, art, architecture, and fashion that explore professional and historic use of conceptualization and metaphor."--Publisher description.

BIM Design Jun 10 2021 Building information modelling (BIM) is revolutionising building design and construction. For architects, BIM has the potential to optimise their creativity while reducing risk in the design and construction process, thus giving them a more significant role in the building process. This book demonstrates how innovative firms are using BIM technologies to move design away from the utilitarian problems of construction, engaging them in a stunning new future in the built environment. Whereas recent books about BIM have tended to favour case-study analyses or instruction on the use of specific software, BIM Design highlights how day-to-day design operations are shaped by the increasingly generative and collaborative aspects of these new tools. BIM strategies are described as operations that can enhance design rather than simply make it more efficient. Thus this book focuses on the specific creative uses of information modelling at the operational level, including the creative development of parametric geometries and generative design, the evaluation of environmental performance and the simulation and scheduling of construction/fabrication operations. This book also engages BIM's pragmatic efficiencies such as the conflict checking of building systems and the creation of bills of quantities for costing; and in so doing it demonstrates how BIM can make such activities collaborative. Throughout, projects are used to illustrate the creative application of BIM at a variety of scales. These buildings showcase work by firms executing projects all over the world: SHoP Architects and Construction (New York), Morphosis (Los Angeles), Populous (London), GRO Architects (New York), Reiser + Umemoto (New York), Gensler (Shanghai) and UNStudio (Amsterdam).

Case Study Houses Dec 04 2020 The 'Case Study House' program ranks among the most influential and innovative projects in American architectural history of the post-war period and has lost none of its fascination even today. The experimental designs of renowned avant-garde architects such as Richard Neutra, Craig Ellwood, Raphael Soriano and Eero Saarinen succeeded in presenting unique houses that completely redefined the concept of modern living. The present publication interprets the 'Case Study Houses' using the new digital tools that architects now have at their disposal and which make the projects accessible in a wholly different way. While traditional documentation provides floor plans, sections, elevations and perspectives, we are now achieving new insights into the concepts, structure, construction, design and spatial effects of the houses by using 3D models, BIM data and atmospheric visualization as well as advanced image processing. It is even possible to download 3D models of some of the houses and try out novel approaches to individual projects. Above all, the book will serve as an inspiration for new architectural ideas and promote the use of these technologies in the design, visualization and realization of such concepts in creative and innovative ways.
